

参数绑定（基本类型参数）

代码步骤

1、建立实体类（省略get,set,tostring）

User类

```
public class User implements Serializable{  
  
    private String uname;  
    private Integer age;  
}
```

Account类

```
public class Account implements Serializable{  
  
    private String username;  
    private String password;  
    private Double money;  
  
}
```

2、新建param.jsp

```
<%@ page contentType="text/html;charset=UTF-8" language="java" %>  
<html>  
<head>  
    <title>Title</title>  
</head>  
<body>
```

```
<a href="param/testParam?username=hehe&password=123">请求参数绑定</a>
```

```
</body>  
</html>
```

3、测试

```
@Controller  
@RequestMapping("/param")  
public class ParamController {  
    @RequestMapping("/testParam")  
    public String testParam(String username,String password){  
        System.out.println("执行了...");  
    }  
}
```

```
System.out.println("用户名: "+username);  
System.out.println("密码: "+password);  
return "success";  
}  
}
```
